

## The Amazing Wonders of Composting

By Andrew Houston

West Elementary School, Great Falls, MT

What's yummy to worms, Oscar the Grouch loves, and is healthy for the environment ? Composting. Composting is where we divide yummies and yuckies and have a bacteria called bokashi eat the yummies for 90 days and turn it into rich soil. Composting is important and has changed the way I think about the Earth. Composting is important because by doing it we can save the Earth. It makes me think it is great because I can help the world.

Composting is important to every living thing on the planet. We can grow food from the soil and keep nature alive. We could make less endangered species by growing some plants and other things they could eat. We could be smarter in using natural resources. We could become healthy too. Our state would have less landfills. The population of animals could rise. We could all be more healthy. We could work together and become more eco-friendly. We could be happy. Our schools could learn a lot more things and help. We would have fun too. It can bring us together as a community.

Recycling food has changed the way I think. I have learned many things about composting and what it does. I now think about what composting will do and it has gotten me excited. I think about how we could help the world, us, and all the other stuff in nature. I think we could teach all the people in the world and we can work with them to save our planet. I think that we could save all the endangered species.

What has yummies and yuckies and is green all over? Composting. By using this we can save the Earth.
